Journal of Clinical Research and Development is an Open Access journal offering complete free access to peer reviewed scientific articles as they are published. This journal offers a platform for publication of scientific clinical research that can be freely accessed globally to improve human health and knowledge fostering clinical research as well as its subsequent development.

Many journals publish research and it remains out of free access for long periods of time to other researchers except those who can afford to pay and gain access. This in the way limits advancement of knowledge and yet many of these researches are funded by public money. International bodies like United Nations Educational, Scientific, and Cultural Organization (UNESCO) [1], European Commission [2] and National Institutes of Health (NIH) [3] support online free access to scientific research. For many journals that restrict online free access indirectly hinder development of scientific research aimed at improvement of human health and knowledge. Many individuals and organizations in the world especially the developing and third world nations cannot afford the charges required to gain access to these journals and in the end the research published by these journals will be limited to

only a few who can afford to meet these subscription requirements further widening the gap in the scientific research knowledge aimed at benefiting humanity.

There should be free online access to scientific research to enable different researchers from every part of the world access freely these researches so that they benefit from the findings by applying them to study similar conditions in their settings or even improve approaches used. Mainly open access journals like Clinical Research & Development: Open Access is certainly helping both researchers in low-income, medium, and developed nations gain access to online peer reviewed articles unlike other journals that require payment to access articles. These journals most of the times are accessed by researchers in the developed world with resources. Therefore free online open access clinical research journals enables researchers and academia in different parts of the global access and publish their clinical research while maintaining the highest quality required for clinical research. If a researcher's goal is to increase knowledge for the benefit of all — otherwise, why publish? — paying publication fees to a journal that restricts online access effectively hinders that goal [4]. We promise that your articles will be peer reviewed by competent individuals and freely accessible by researchers of globally on publication.
